It is recommended to completely avoid all tested items with Moderate or High reactivity scores. If tested Low reactive foods have been consumed regularly before testing, there is a high probability that they are not likely to provoke symptoms, as long as there is no history of allergic, autoimmune, or other types of inflammation-provoking or symptom-provoking reaction. Degrees of test reactivity may not in all cases correlate with the levels of clinical symptoms provoked by the tested food or chemical. These test results can form the basis of an eating plan developed under the guidance of a physician, dietitian, or other qualified healthcare practitioners.

# The LEAP Timeline

What can you expect working with your Certified LEAP Therapist?  
This is just one possible example of how your CLT may work with you, but packages and policies vary. Your needs may differ.
